Professional Summary

Web developer since 2016, with experience contributing to the development and modernization of SmartX cloud and hyperconverged infrastructure management platforms, alongside frontend and full-stack development for e-commerce, warehouse and other business systems. In 2024–2025, explored AI-assisted full-stack development and early AI applications, focusing on combining model capabilities, tool calling and business workflows, with an evolving focus on AI agent application development.

Core Skills

Frontend: React / Vue.js / TypeScript / CSS / SCSS

Backend & Data: Node.js / GraphQL / MongoDB

Experience

TRIsoft

Tokyo, Japan

Full-stack Development / AI Applications 2024 — 2025

- **AI-assisted full-stack development:** Developed full-stack applications with emerging AI tools, combining AI-generated code with human review, debugging and integration in a semi-automated workflow to support application prototyping and iterative feature development.
- **Early AI application practice:** Explored integrating RAG and function calling into applications, combining knowledge retrieval with model generation and using function calls to connect application functionality, validating ways to incorporate large language models into full-stack applications.

Web Developer 2022 — 2024

- **E-commerce performance optimization:** Developed and maintained the company's tire e-commerce platform. Addressed large-table performance issues in order management, trading-condition configuration and inventory management with virtual scrolling, paginated loading and React re-render optimization. Improved data loading, component updates and complex form state management, reducing redundant requests and renders to improve responsiveness and usability.
- **Warehouse management system development:** Contributed to a warehouse management system (WMS), focusing on inventory data consistency, complex business state transitions and frontend–backend data exchange. Implemented complex forms, barcode and QR code input, data validation and synchronization after inventory changes, helping digitize warehouse operations and reduce manual work and information reconciliation.
- **Real-time live comment system development:** Developed a live-stream comment system, organizing message reception and state management over persistent WebSocket connections. Coordinated initial message history with incoming incremental messages and handled deduplication. Used batched updates and rendering optimization to reduce overhead under frequent messages, maintaining continuous display and responsive interactions, including mobile adaptation.
- **System iteration and stability:** Contributed to ongoing development across multiple business systems, handling feature extensions, API integration, production troubleshooting and compatibility fixes to support stable e-commerce, warehouse and live-streaming operations.

Experience

株式会社幻夢Gem

Tokyo, Japan · Remote

Frontend Engineer Dec 2021 — Oct 2022

- Took full responsibility for frontend development and maintenance of web applications.
- Collaborated remotely with the Tokyo team on requirements, integration and iterative delivery.

SmartX

Beijing, China

Frontend Engineer / Product Designer Oct 2017 — Sep 2020

- Rebuilt Fisheye's web management interface with React, TypeScript and GraphQL, developing and maintaining page components, data queries and business interactions.
- Used the team's in-browser GraphQL data layer to access existing backend services, organizing cross-API data through a consistent query interface and reducing manual data assembly in pages. Applied schema and TypeScript constraints to catch field and data type mismatches during development.
- Customized and maintained a WordPress-based blog system, implementing page layouts, visual styles and article display functionality.
- Built an internal translation platform tailored to documentation engineers using Vue.js, Node.js and MongoDB, with terminology management, multilingual translation, status monitoring, error detection and support for related tool integrations.
- Built a bug monitoring and reporting platform, using rrweb to replay browser interactions and help reproduce and investigate issues.
- Designed features for the core product and built interactive prototypes with a small amount of coding.

Design Engineer Sep 2016 — Oct 2017

- Contributed to Fisheye, the front-end project for SmartX OS, implementing page templates, styles and interactions with Slim, SCSS and CoffeeScript, building interfaces with AngularJS and Vue.js, and managing automated builds with Gulp.
- Designed and implemented a UI component library, turning visual and interaction designs into reusable components.
- Designed and developed the company website and mobile promotional pages, implementing layouts, styles and interactions.

Product Team Intern Apr 2016 — Sep 2016

- Developed UI components within the product team, implementing layouts, visual styles and interaction states with CSS and SCSS.
- Created and organized component designs in Sketch, matching dimensions, spacing and colors in the front-end implementation.
